The present sequence is of a trityl deprotected hydrazide phosphoramidite 15-mer, designated oligo 031, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, Proptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, ot for other conjugation reactions. The process is useful e.g. in nucleic acid hydridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mueller-Ibeler J, Schweitzer M, Bruecher C, Windhab N;

applications

```
The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 034, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieries, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                       /*tag= a

control gene expression.

The present invention relates to methods and oligonuclectides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonuclectide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonuclectide bluds in a parallel and antiparallel corientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation where gene expression regulatory sequences of a target gene. The oligonuclectides can be used to form triple-helices, and are useful to configuration to a pasence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be selected to specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonuclectide can be chosen to target a unique sequence of the configuration or virulence, reducing their pathogenic has triple helix the genome of pathogen whose The configuration or virulence, reducing their pathogenic sequence of the configuration or virulence, reducing their pathogenic the virules the configuration or virulence, reducing their pathogen which is not found in the genome of pathogen is host. The oligonuclectides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel confentation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA or adamostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix colling and the pathogen which is not found in the genome of pathogen's host. The origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention suppression of specific oncogenes including those of endogenous or viral

genetic packages that display and/or express a diverse family of peptides, polypeptides or proteins. ABZ36912 to ABZ37510 and ABP55464 to ABP55499 represent sequences used in the exemplification of the present

The present sequence is that of the 5' end of a cDNA clone was isolated a cDNA library e.g. a mosquito antenna library. A clone was isolated a cDNA library e.g. a mosquito antenna library. A clone was isolated to rapidly array and normalize a complex cDNA library obtained from a target species. Clones are arrayed into multilibrary obtained from a target species. Clones are arrayed into multilibrary obtained from a target species. Clones are ABV74137) with a complementary a poly-T run capable of binding cDNAs by their poly-A tail and a unique 3' sequence of liprace of liprace and complementary 5' end. The unique 3' key sequences are designed to give a complementary 5' end. The unique 3' key sequence can be bound by an comprehensive level of degeneracy since they are diverse and numerous complementary 5' end. The unique 3' key sequence can be bound by an individual, specific oligonucleotide in a single well. The cDNA library is heated to denature the clones into single stranded DNA, and an aliquot is added to every well. The anchored oligonucleotide serves as the 3' priming site. Denaturing and washing leave anchored cDNA in each well The library is now arrayed and normalised. The method was complement receptors, and active effectors involved in the capecially odourant receptors, and active effectors involved in the oligance clones encoding c-protein complex receptors, and scrive as clones encoding c-protein complex receptors, and active effectors involved in the oligance clones and vertebrates, e.g. odourant binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying nucleic acid encoding novel sex-linked-tissue-linked receptors, useful for isolating odorant binding proteins or pesticide alternatives, by analyzing sequences from a male- and female-specific nucleic acid library.

                                                                                                                                       23-JAN-2003
                                                                                                                                                                                                                                                                                                                                                                                               03-OCT-2002.
                                                                                                                                                                                                                                                                                                        Synthetic.
                                                                                       ABV74142;
RESULT 1067
```

The present invention describes a method for cleaving single-stranded nucleic acid sequences at a desired location. Also described: (1) methods of driverse family of peptides, collectively displaying at least a member of a diverse family of peptides, polypeptides or proteins on the surface of a genetic package and collectively displaying at least a part of the diversity of the family, where the displaying at least a part of the diversity of the family, collectively displayed or expressed peptide, polypeptide or protein is encoded at least in part by a mucleic acid that has been cleaved at a desired location; (2) a method for preparing single-stranded nucleic genetic packages that display a member of a diverse family of peptides, polypeptides or proteins and that collectively display at least a portion of the family; (4) a vector comprising a DNA sequence encoding an antibody variable region linked to a version of PIII anchor which does not method for producing a population or a library of immunoglobulin genes; and (6) a library of immunoglobulins that comprise members having at least one variable domain in which at least one of CDR1 and CDR2 contain comprise in entity of sequences at a synthetic diversity and CDR3 diversity and cDR3 diversity and cDR3 diversity and contain subsequently used to produce libraries or

                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a poly-T oligonucleotide used in a method designed to rapidly array and normalize a complex cDNA library obtained from a target species. Clones are arrayed into multi-well plates. Each well contains 16 oligonucleotides with a 5' polylinker, a poly-T run capable of binding cDNAs by their poly-A tail and a unique 3' sequence, which allows an anchored oligonucleotide in each well to selectively hybridise only to those cDNA clones with a complementary 5' end. The unique 3' key sequences are designed to give a comprehensive level of degeneracy since they are diverse and numerous enough to ensure that
proteins, or other olfactory or neuronal proteins. The identified receptors and proteins are useful for identifying compounds that reduce a target animal's sensitivity to oddours, for manufacturing compounds or devices that mask oddurs, or trapping invertebrates with oddurants. Semiochemicals (e.g. arometics or pheromone mimetics) can be developed with desirable effects on specific species, for the development of pest monitoring systems or non-toxic, species-specific pesticide alternatives, for controlling insect feeding and breeding behaviour, detecting the presence of small air-borne molecules, etc
                                                                                                                                                                                                                                                                                                                                                                                         G-protein coupled receptor; odourant; receptor; olfaction; array; microarray; anosmia; attractant; arometic; pesticide; PCR; primer; ss.

```
cevery possible cDNA sequence can be bound by an individual, specific oligonucleotide in a single well. The cDNA library is heated to denature the clones into single stranded DNA, and an aliquot is added to every well. The anchored oligonucleotide serves as the 3' primar in PCR, and the common 5' region present in every CDNA clone serves as the 5' priming site. Denaturing and washing leave anchored cDNA in each well. The library is now arrayed and normalised. The method was used to identify and isolate clones encoding G-protein coupled receptors, especially candisolate clones encoding G-protein coupled receptors, especially colourant receptors, and active effectors involved in the olfactory pathway of invertebrates and vertebrates, e.g. odourant binding proteins, or other olfactory or neuronal proteins. The identified receptors and proteins are useful for identifying compounds that reduce a target proteins are useful for identifying compounds that reduce a target canimal's sensitivity to odours, for manufacturing compounds or devices that mask odours, or trapping invertebrates with odourants. Semiochemicals (e.g. arometics or pheromone mimetics) can be developed controlling insect feeding and breeding behaviour, detecting the monitoring systems or non-toxic, species-specific pesticide alternatives, correspondent of small air-borne molecules, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligonucleotide deprotection reagent useful for deprotecting oligonucleotide comprises an active methylene compound and an amine reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

```

The invention discloses a hairpin sensor comprising a hairpin loop assembly including a complementary probe positioned between a first inverse repeat arm and a second inverse repeat arm, and a quenchable fluorescing agent joined, directly or indirectly, to the end of the complementary probe. Also claimed is a microarray comprising the hairpin sensor, where the end of the first inverse repeat arm opposite the complementary probe is bound, directly or indirectly, to a support, a kit for detecting a target nucleotide sequence in a sample comprising the hairpin sensor, and a support, and a hairpin sensor system, in which the complementary probe is support, and a hairpin sensor system, in which the particle is conductive or semi-conductive, including at least one of the particle is conductive or semi-conductive, including at least one of the particle is conductive or semi-conductive, including at least one of the particle is conductive probe, or first spacer comprises a composite the complementary probe, or first spacer composite the first inverse repeat arm, the functional group selected from amino, carboxyl, cincluding agent, where the ligand is selected from mercapto, hydroxyl, amino, nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The second inverse repeat arm and the composite the ligand is selected from mercapto, hydroxyl, amino, nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The contrible fluorescing agent which comprises a semiconductor nanocrystal or rhodamine B-labelled dye. Within the microarray the support is capable contrible active a charge. The two or more hairpin sensors include complementary probes that are the same or different and respective quenchable. hairpin sensors are arranged in a spatially-defined pattern. The sensor and system are useful for detecting a target nucleotide sequence in a sample. Further, the method involves identifying the target nucleotide sequence by the location of the complementary probe to which the target nucleotide sequence binds. The two or more hairpin sensors include complementary probes or quenchable fluorescing agents, that are different. The sequence presented is the hairpin oligonucleotide target sequence, #1, used in an example of the invention. Sequence 15 BP; 15 A; 0 C; 0 G; 0 T; 0 U; 0 Other; 04-DEC-2003 (first entry) ADB68520; Query Match RESULT 1071 Matches ADB68520, 셤 XXXEXEXEXEXEXEXEXEXEX ò ö The present invention provides a method for deprotection of an oligonucleotide. This involves reacting a protected oligonucleotide, which is preferably covalently attached to a solid support through a linkage, with a deprotection reagent comprising an active methylene compound and an amine reagent. The process and reagent minimise sidereactions leading to certain impurities that contaminate synthetic oligonucleotides. The present sequence is a T15 phosphoramidite oligonucleotide having a quencher moiety (Q) and minor groove binder (CDPI3) at the 3' end, which was synthesised in an example of the invention. This protected oligonucleotide was treated either with 15% ethanolic ammonia or with 3% diethylmalonate (DEM) dissolved in 15% ethanolic ammonia for 2 hours at 55 degrees C. HPLC analysis showed that deprotection without DEM yielded a complex mixture of products containing analysis of the degired product. When DEM was used, 76.8% of the /bound\_moiety= "Hairpin oligonucleotide #1" /note= "Forms a doube-stranded region with the hairpin oligonucleotide shown in example 2" Hairpin sensor; hairpin loop; complementary probe; inverse repeat arm; quenchable fluorescing agent; microarray; semiconductor; nanocrystal; rhodamine B-labelled dye; detection; gold support; ss.                                                                                                                                        The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonuclectide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monometro a cell or organism or their extracts. In coligonuclectides of the invention may be used to monitor properties including gene expression, respiration, secretion, signalling, ion-channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is etcivity of some enzymes, such as polymerases. The current sequence insention. This sequence may also comprise a peptide nucleic acid (PNA), a phosphono-PNA (PPNA) or a HypNA.
                                                                                                                                                                                                                                                                                                                                                                               ö

inte present into present in autoextical an autoextical and printed for the present into present into present into present into present into present into present and a read and a read and a site on a template nucleic acid for hybridisation, as 5'-end portion having a pre-selected arbitrary nucleotide sequence, and a regulator portion having a pre-selected arbitrary nucleotide sequence, and a regulator portion having a pre-selected arbitrary nucleotide sequence, and a universal or non-confidence and angulation of the primer in association with a regulating an annealing portion of the primer in association with a negligible of regulating an annealing portion of the primer in association with an interest of angulativation of angulativation and angulativation of angulativation and angulativation and angulativation and angulativation and angulativation angulativation angulativation angulativation angulativation angulativation angulativation angulativation areaction using (I).

(I) is also useful for repidly amplifying a target confidence of the angulativation and angulativing a target of the angulativing a target of angulativing a target comprising a complementary to mRNAA, and amplifying 5'-end or 5'-end or 5'-end complementary to mRNAA, and amplifying 5'-enriched double-stranded cDNAB complementary to mRNAA, and amplifying 5'-enriched pequence simulation of for carget complementary to mRNAA, and amplifying appaining more than one pair of for carget and the paramagnetic sequence from the paramagnetic pequence simulation and paramagnetic peducation in the paramagnetic peducation in the paramagnetic peducation in the paramagnetic peducation in the paramagneti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primers in the same reaction, where the primers are derived from (1), for producing a DNA fingerprint of genomic DNA (gDNA), for producing a RNA fingerprint of an mRNA sample, identifying conserved homology segments in a multigene family from an mRNA sample, and for identifying conserved homology segments in a multigene family from gDNA. (1) is also useful for identifying a nucleotide variation in a target nucleic acid, and for mutagenesis in a target nucleic acid. The present sequence represents a primer which is used in the exemplification of the present invention.
                                                                                      The present invention describes an annealing control primer (ACP) (I) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptides having at least two new nucleotides - useful as primers in RT-PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma) k-delta-N3'; where X = a labelled compound and/or nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; amma = thymine; R = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sednences

Peptides having at least two new nucleotides - useful as primers in

Disclosure, Page 10; 19pp; Japanese.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)\*K-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adennine, guanine or cytosine; N = adenine, guanine or thymine; A = netural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of repetition of gamma, in which thymine expressed by gamma is composed of 13 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene вестепсев RESULT 1074

In the native state, the probe forms a hairpin conformation with hybridised termini. The probinity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present. Single mismatches can be detected. The invention relates generally to the use of metal surface quenchers such as particles or fillms for high sensitivity applications in, for example, detection and diagnostic systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a perfectly matched target sequence for a

The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts oligonucleotides of the invention may be used to monitor properties including gene expression, respiration, secretion, signalling, ion-channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is that of the PNA-HypNA hybridisation oligomer of the invention. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence may also comprise phosphono-PNA (pPNA) and serine nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Method of inhibiting expression of genes or RNA transcripts, useful f
therapy and determining effects of genes, by administering oligomers
containing hydroxyproline nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for detecting interactions between biological components using a nonlinear optical technique. The invention is used for screening candidate binding partner(s) for binding to test molecule. It can also be used to detect changes in orientation or conformation of the probe and/or target. The present sequence is a target oligonucleotide used in nonlinear optical technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Screening candidate binding partner(s) for binding to test molecule by applying external force field to sample in homogeneous phase, illuminating sample with light beam(s) at fundamental frequencies, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hydroxyproline nucleic acid; HypNa; PNa; peptide nucleic acid; gene expression; respiration; secretion; signalling; ion-channel activity; cell motility; developmental phenotype; tumour regression; hybridisation; ss; serine nucleic acid; SerNa;

Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

Claim 2; Page 201; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a growth factor (VEGF). A patient fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                          Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                       KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;
tumour angiogenesis; psoriaais; rheumatoid arthritis; ocular disease;
fms-like tyrosine kinase 1; kinase insert domain containing receptor;
foetal liver kinase 1; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression lavels e.g. to inhibit cell profiferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic and molecule or the expression vector to the patient. AAX67575 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                       Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; epidermal growth factor receptor; EGFR; EGF-R; target sequence; hammerhead ribozyme; hairpin ribozyme; inhibition; cell proliferation; cancer; genetic drift; detection; mutation; ss.

```
DNA and encoded protein which activates eosinophil cells - for treatment of cancer, parasite infection, autoimmune disease and allergic inflammation.
                             Protein from leukocytes and DNA encoding it - useful as reagents for diagnosing and treating IgA nephropathy.
                                                                                                                                                                                                                                                                                                                                                                 Bosinophil cell activator; treatment; diagnosis; malignant tumour; parasitic infection; allergic inflammation; eosinophilic pneumonia; rapid onset eosinophilia; autoimmune disease; gene therapy; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a PCR primer used in the identification of a human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IgE) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, and screening candidate

                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                    PCR primers AAV37933-39 are used in the course of the invention. The specification descibes a novel protein isolated from leukocytes of patients with IgA nephropathy. Oligonuclectides based on the DNA sequence encoding this protein are useful as reagents for diagnosing and treating IgA nephropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV49503-V49507 are primers used in the isolation of a human eosinophil cell activator. This protein and antibodies generated from the protein can be used for treatment and diagnosis of malignant tumours, parasitic infections, allergic inflammation, eosinophilic pneumonia, rapid onset eosinophilia, and autoimmune diseases. DNA can be used for diagnosis, and the antisense DNA in gene therapy of these disorders. The protein can be used for screening of potential agonists or antagonists of its activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     88.

The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IGE) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, particularly cedar pollenosis, and screening candidate compounds for pollenosis treatment
                                                                                                                                                                                                                                    Gunji S;
                                                                                                                                                                                                                                                                                                 Gene highly expressed in patients with high cedar pollen-specific IgE levels, useful for diagnosing pollenosis, and screening candidate compounds for pollenosis treatment.
                        Pollenosis-associated protein; high pollen-specific immunoglobulin B; IgE, diagnose; cedar pollenosis; treatment; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nephropathy-associated protein; diagnosis; treatment; antisense;
PCR primer GT15C used in pollenosis associated gene identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                 This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover diagnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences; the treatment of IgA nephropathy using the antisense sequences for mRNA inhibition, proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins by coulture of host cells transformed with DNA encoding them; diagnostic reagents for IgA nephropathy containing the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of IgA nephropathy. This sequence represents a primer used in the isolation and identification of the human IgA nephropathy-associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kuga T;

This invention describes a novel method for analysis of an RNA sample which comprises amplifying cDNA with first and second differently labeled primers and analysis of the amplified labeled cDNA. The method is useful for analyzing differential gene expression, for identifying and/or characterizing pharmacological activities or for identifying target amplies. The use of different primer combinations allow more cDNAs to be amplified. The method also provides a more detailed analysis than prior art methods. This sequence represents a primer used to illustrate the
                                     incorporating the antiennes sequences; the treatment of 19A nephropathy using the antiennes sequences for mRNA inhibition; proteins associated with 19A nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them; diagnostic reagents for 19A nephropathy containing the antibodies; and compositions for the treatment of 19A nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of 19A nephropathy. This sequence reppresents a primer used in the isolation and identification of the human 19A nephropathy-associated proteins described in the method of the invention
them. Independent claims cover diagnostic reagents for 1gA nephropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of RNA samples, useful for detection of differential gene expression uses two differently labeled primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 17;

display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify disease of the target to the probe. The methods can be used to dentify disease states, such as cancer, autoimmune disease, infectious disease, aging, differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially epidernal growth factor), radiation, stress or a pathogen. The methods can also be used to determine co-regulated genes that can be potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

with a target sequence and contain at least one phosphoroidilthicated link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA22992 represent their corresponding target sequences. AAA25993 to AAA26105 represent coestrogen receptor hairpin ribozyme sequences, and AAA26107 to AAA26118 represent their corresponding target sequences. AAA26219 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26217 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
present invention describes nucleic acids (A) that interact stably

with high cedar pollen-specific IgE (immunoglobulin B) levels of individuals with high cedar pollen-specific IgE (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis gene 373; expression constructs and cost cells comprising pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 373 nucleic acids; and a method of disgnosis of allergic diseases via the detection of pollinosis-associated gene 373 nucleic acids; and a method of disgnosis of allergic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 373 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control.

Creals in the presence of a test compound relative to a control.

Creals in the presence of a test compound relative to a control.

Creals in the presence of a test compound relative to a control.

Creals in the presence sequence represents a PCR primer used in the cauch diseases. The present sequence represents a PCR primer used in the control of human pollinosis-associated gene 373 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pollinosis-associated gene 373 undergoing significantly low expression in subjects with high cedar pollen-specific immunoglobulin-E levels, useful in diagnosis of allergic diseases and screening drug candidates.
                                                                                                                          Human, pollinosis-associated gene 373; IgE; immunoglobulin E; cedar pollen allergy; T-cell; reduced expression; detection; diagnosis; drug screening; allergic disease; PCR primer; ss.

```
The invention relates to the human pollinosis-associated gene 373 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis gene 373; expression constructs and host cells comprising pollinosis-associated gene 373 nucleic acids; collinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 nucleic acids; protein encoded by the gene; methods of detection of pollinosis-considered gene 373 nucleic acids; associated gene 373 nucleic acids; associated gene 373 nucleic acids; and a method of dispnosis of allergic dispasses via the detection of pollinosis-associated gene 373 nucleic acids; acids. The invention additionally encompasses methods of screening drug acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 373 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control.

Tollinosis-associated gene 373 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 373 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 0 A; 1 C; 1 G; 15 T; 0 U; 0 Other;

Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

Example 6; Page 49; 77pp; Japanese.

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen specific IgB (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Pas-associated factor-1 [PRF-1]. The invention also callers to the protein encoded by pollinosis gene 419; expression relates to the protein encoded by pollinosis gene 419; expression calls; pollinosis-associated gene 419 primers and probes; antibodies against the protein encoded by the gene; method of detection of pollinosis-associated gene 419 nucleic acids; and a method of disquests of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids. The invention additionally encompasses of somethods of soreening drug candidates for the treatment of allergic methods of soreening drug candidates for the treatment of allergic completed gene 419 in the pollinosis-associated gene 419 in the diseases and in the screening of authorioral pollinosis-associated gene 419 in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of allergic diseases. The presente requence represents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Fas-associated gene 419 has homology with the gene condition and protein encoded by pollinosis-associated gene 419 primers and probes; antibodies against the protein encoded by pollinosis-associated gene 419 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 419 mucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 419 in the presence of a test compound callagnosis of allergic diseases. The presence of a test compound callagnosis of allergic diseases. The presence expresents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA
                                                                                                                                                                                                                                                                                                                        Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific 198 (immunoslobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to methods of detection of pollinosis-associated gene 513 nucleic acids; and methods of screening drug candidates for the cannot of allergic disease via the detection of pollinosis-associated correspond to a lergic disease by measuring the expression of pollinosis-associated gene 513 nucleic associated gene 513 nucleic associated gene 513 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 513 is useful in the diagnosis of allergic diseases and in the screening of arung candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-Pollinosis-associated gene 513 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates. Pollinosis-associated gene 513 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

Example 6; Page 38; 46pp; Japanese.

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific 1gg (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to method of deaction of pollinosis-associated gene 513 nucleic acids, a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 513 nucleic acids, and methods of screening the expression of pollinosis-associated gene 513 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 513 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 513 its useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosisassociated gene 513 cDNA

ŝ

Pollinosia-associated gene 795 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

Page 45; Example 6; 73pp; Japanese.

The invention relates to the human pollinosis-associated gene 795 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has homology with the human vimentin gene. The invention also relates also relates to the protein encoded by pollinosis-associated gene 795 to expression constructs and host cells comprising pollinosis-associated gene 795 constructs and host cells comprising pollinosis-associated gene 795 constructs and host cells comprising pollinosis-associated gene 795 nucleic acids; pollinosis-associated gene 795 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 795 nucleic acids; and a method of companing the expression of pollinosis-associated gene 795 nucleic acids; and a method of sereening drug acudidates for the treatment of allergic diseases with the presence of a llergic disease by measuring the expression of pollinosis-associated gene 795 in pollen antigen-stimulated T-cells in the presence of a test compound relative to antigen-stimulated T-cells in the presence of a test compound relative to allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 795 cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pollinosis-associated gene 465 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and its useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T calls to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T calls to the stimulus by an antigen. The present sequence represents a PCR primer which is used in

The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pollinosis-associated gene 465 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nagasu T, Sugita Y, Kashiwabara T, Oshida T, Obayashi M, Gunji

The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential display method. The invention also relates to pollen using the differential display primers and probes; methods of detection of pollinosis-associated gene 787 nucleic acids, and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 787 nucleic acids. The invention additionally encompasses a method of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-cassociated gene 787 in pollen antiquen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 787 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases and in the screening of care sequence represents a PCR primer used in the isolation of human pollinosis-Pollinosis-associated gene 787 undergoing significantly low expressio subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus. This invention describes a novel nucleic acid molecule comprising a sequence (I) which undergoes significantly low expression in subjects effer pollen scattering, and is useful in diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel nucleic acid molecule comprising a sequence (I) which undergoes significantly low expression in subjects after pollen scattering, and is useful in diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen
              Pollinosis-associated gene 441 which undergoes lower expression in usubjects after Pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of cells to antigen stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pollinosis-associated gene 441 which undergoes lower expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kashiwabara T, Oshida T, Obayashi M,

The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B1001, B1466, B1072 or B1151 in T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes

acetyltransferases in the eosinophils of a patient and comparing the expression level with that in the eosinophils of a healthy individual (i.e. differential display). Also included are methods of screening for candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence in the examination of allergic diseases, the use of reporter constructs in the screening of candidate compounds, a vector containing a the transcription controlling region of the gene, cells transformed with the vector, an antibody against the protein and a model animal for allergic diseases which is a transgenic non-human vertebrate with lowering of expression intensity of the gene in eosinophils. The method is examining allergic diseases particularly atopic dermatitis which is also applicable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Examining allergic diseases by differential display of gene showing different expression particularly increased expression in remission stage in eosinophils of patients, also applicable in screening candidate compounds for remedies.
                                                                                                                                                                                                                                                                                                                                                                                                                                      in high throughput, at low cost. The present sequence is a differential display PCR primer for the cDNA encoding the human acetyltransferase-like protein 20-90-05
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, 88; PCR; acetyltransferase; 20-90-05; allergic disease; primer; differential display; eosinophil; antiallergic; atopic dermatitis; GT15C.
                                                                                                                                                                                                                                                                                                                                                                                                                  screening candidate compounds for remedies. Such method can be performed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tsujimoto G;
                                                           The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human cDNA appearing as ABK49633 which has homology with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human Acetyltransferase-like protein 20-90-05 PCR primer GT15C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B1001, B1466, B1072 or B1151 and T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ss; PCR; acetyltransferase; 20-90-05; allergic disease; primer;

The invention relates to a method for examining allergic diseases

Comparises determining the expression level of a gene containing, the
human cDNA appearing as ABK49633 which has homology with
acetyltransferases in the eosinophils of a patient and comparing the
expression level with that in the eosinophils of a healthy individual

(i.e. differential display). Also included are methods of screening for
candidate compounds which affect the expression level of the gene or the
activity of the protein encoded by the gene (including related proteins
and mutants), the use of probes based on the gene sequence in the
examination of allergic diseases, the use of reporter constructs in the
controlling region of the gene, cells transformed with the vector, an
antibody against the protein and a model animal for allergic diseases
which is a transgenic non-human vertebrate with lowering of expression
intensity of the gene in eosinophils. The method is examining allergic
diseases particularly atopic dermatitis which is also applicable in
the protein endidate compounds for remedies. Such method can be performed
to high the broad and the protein method is also applicable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                    in high throughput, at low cost. The present sequence is a differential display PCR primer for the cDNA encoding the human acetyltransferase-like protein 20-90-05
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Examining allergosis, involves measuring the expression levels of a specific gene, and comparing it to the levels in the eosinophils of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used

The present invention relates to a method for examining allergic diseases which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN9812-ABN99812, in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the exemplification of the invention
                                                                                                                                                                                                                                                                     Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; allergy; atopic dermatitis; eosinophil; anti-allergic; PCR;

The present invention relates to a method for examining allergic diseases which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99812-ABN99828, in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the

Saito H;

Nagasu T,

The present invention relates to a method of examining allergic diseases which comprises comparing the expression level of gene B1153 in allergy patients with the expression level in healthy subjects. The method is useful for the treatment, prevention, diagnosis and study of allergic

The present invention relates to a method for examining allergic diseases with intersectin 2 gene or a gene with equivalent function of intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the eosinophils in a patient, and comparing the expression level with that in the eosinophils of a healthy individual. The method is for examining allergic diseases, particularly atoppic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Method for examining allergic diseases by differential display of intersectin 2 gene showing different expression particularly significant increase in eosinophils in patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Allergic disease examination method related anchor primer SEQ ID NO: 3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method of examining allergic diseases which comprises comparing the expression level of gene Bl153 in allergy patients with the expression level in healthy subjects. The method is useful for the treatment, prevention, disgnossis and study of allergic diseases including atopic skin inflammation and asthma. The present sequence is a PCR primer described in the exemplification of the

The present invention relates to a method for examining allergic diseases with intersectin 2 gane or a gane with equivalent function of intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the eosinophils in a patient, and comparing the expression level with that in the eosinophils of a healthy individual. The method is for examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for examining allergic diseases by differential display of intersectin 2 gene showing different expression particularly significant increase in eosinophils in patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological, antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabbetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome; leukaemia; osteoporosis; DNAzyme; inozyme;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, culgarist, anglodensis, diabetic retinopathy, macular degeneration, culgarist, anglodibroma of tuberous sclerosis, port whise stains, Sturge (Weber syndrome, Paletra Harding a patient having a condition associated with the level of ERG, syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for creating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or call, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of advalent callons such as Masz, 1987, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK, 7354-ABKZ2719 represent nucleic acide, including antisense and enzymatic nucleic acide molecules which regulate expression of ERG, and enzymatic nucleic acide molecules which regulate expression of ERG, and Novel polynucleotide which down regulates expression of Eta-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. gene therapy; transgenic; ss.

Homo sapiens

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (S1), (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequence comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsases as well as commistream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) contexting (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence difformation supplied to prime by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABBA399), a sequence having 65% sequence identity to (Sl), (Sl), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 11s a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of cor identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnoshing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnoshing and treating caused by altered expression of human postluming diagnoshing and treating caused by altered expression of numen constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the privant by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; SEQ ID NO 1503; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 0.9%; Score 15; DB 1; Length 17; Best Local Similarity 100.0%; Pred. ```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (II) is useful for identifying a specific binding partner. (I) and mucleic acids (II) consedubly altered expression of human POSHL1 including disagnosing and creating caused by altered expression of human POSHL1 including disagnosing and treating caused by altered expression of human POSHL1 including macrating caused by altered expression of human POSHL1 including disagnosing and treating caused by altered expression of human POSHL1 including macrating caused by altered expression and creating trensigenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the privated specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining alergic diseases comprising determining the expression levels of these genes and comparing the expression levels of these genes and comparing individual. The method of the invention may have antiallergic or dermatcological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTISa PCR primer used to amplify the differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amplified atopic dermatitis related cDNA sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOI Rep.X; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome; Fredreich's ataxis; myotonic dystrophy; hyperandrogenaemia;
                                                                                                                                                                                                                                                         Examining allergic diseases by differential display of genes show different expression particularly increase in remission stage in eosinophils in patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining allergic diseases comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or dermatcological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTISC PCR primer used to amplify the differentially amplified atopic dermatitis related CDNA sequences of the invention
                                                                    Atopic dermatitis, ss, differential display, primer, PCR; eosinophil; allergic disease, antiallergic; dermatological; GT15c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Atopic dermatitis, 89, differential display, primer; PCR, eosinophil;
allergic disease; antiallergic; dermatological; GT15a.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River Syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for Sequence 17 BP; 0 A; 2 C; 0 G; 15 T; 0 U; 0 Other; Example; Col 483; 588pp; English polymorphic probability.

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 5260; 103pp; English.

proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is cancoded at chromosome 7921.1, MD24 is encoded at chromosome 6921.3-22.2, MD24 is encoded at chromosome 6921.3-22.2, MD24. MD27, MD24, MD27, and MD21 sequences are useful in therapy. Or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring agene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention. present invention relates to novel human zinc finger-containing

New naturally derived DNA specifically expressed during blastogenesis of a plant, useful for producing a transformed plant and for compulsive expression of a protein.

Example 3; SEQ ID NO 2; 43pp; Japanese.

The invention relates to naturally derived DNA specifically expressed during plant blastogenesis. The DNA of the invention is useful for producing a transformed plant. Methods of the invention are also useful for compulsive expression of this DNA. Methods of the invention are useful for plant tissue specific expression of genes. Also, the growth stage of a plant can be controlled specifically. The current sequence represents a PCR primer for amplifying a plant blastogenesis specific gene of the invention.

                                                                                                                                                                                                                                                                                                                                                                              New naturally derived DNA specifically expressed during blastogenesis of a plant, useful for producing a transformed plant and for compulsive expression of a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    during plant blastogenesis. The DNA of the invention is useful for producing a transformed plant. Methods of the invention are also useful for compulsive expression of this DNA. Methods of the invention are useful for plant tissue specific expression of genes. Also, the growth stage of a plant can be controlled specifically. The current sequence represents a PCR primer for amplifying a plant blastogenesis specific gene of the invention.
                                                                                                                                                                        PCR primer for amplifying plant blastogenesis specific gene #SEQ ID 1.
                                                                                                                                                                                              Plant blastogenesis, transformation; gene expression; tissue specific;
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to naturally derived DNA specifically expressed

This invention relates to a novel method for screening and examining allergic diseases by the use of B1799 as the indicator gene. Specifically, it comprises determining the expression level of this indicator gene in a biological sample obtained from the patient, and identifying differential expression (increased expression of B1799) in comparison to that observed in a healthy individual. The present invention describes the B1799 protein as antiallergic, antiliclammatory and dermatological. As such, through the use of gene therapy, this method can be used to treat allergic diseases particularly atopic dermatitis. Furthermore, it is useful for determining a diagnosis that is convenient and non-invasive, and is also applicable in high throughput screening to identify candidate compounds for additional remedies. This oligomucleotide sequence is the DNA oligo (SeqID 5) related to the human B1799 gene of the invention.
                                                                                                                                                      Examining allergic diseases, such as atopic dermatitis, comprises comparing the expression levels of gene B1799 in T cells in a patient and a healthy individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR; primer; amplification; apoptosis; antibody; inhibition; ss; immunohistological staining.

The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hypervariable region; ENV protein; vaccinia virus; gag gene; retrovirus; vaccines; infection; protection; primer; ss.

The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY67598-V67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAV35388-V35414 are primers used in a method which results in a recombinant vaccinia virus comprising of a gag gene from a retrovirus such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope region (30-300 bases in length) of a retroviral gene other than the gag gene may be altered so as to produce a gag protein modified from the natural sequence by the addition, deletion or substitution of at least 1 amino acid residue. The fusion gene is inserted into a recombinant vaccinia virus vector which is used to transform a host cell (such as the La, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon culturing the host cell produces particulate structures containing the protein page protein. The recombinant varus or the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein particles may be used in the production of vaccines for

The present invention relates to functionalised nanocrystals for use in nonisotopic detection systems for biomolecules e.g. nucleic acids, proteins, lipids or drugs. The nanocrystals have polymucleotide strands attached to their surfaces with one end of the polymucleotide extending outwardly from the nanocrystal. The present sequence is one such nanocrystals, which have polymucleotides complementary to the first polymucleotides, so that the respective complementary to the first polymucleotides, so that the respective complementary strands hybridise to each other and form a dendrimer. This enditimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Adenine bases. This sequence may therefore be used
                                                                                                                                                                                                Functionalized nanocrystal carrying polynucleotide, used for detecting target analyte, forms dendrimers with complementary nanocrystals to amplify the fluorescent signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Functionalized nanocrystal carrying polynucleotide, used for detecting target analyte, forms dendrimers with complementary nanocrystals to amplify the fluorescent signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nanocrystal; biomolecule detection; nonisotopic detection system; ss.

The genes (AA296631-633) and the proteins (AAV67589-V67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AA296640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                 Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

The present invention relates to functionalised nanocrystals for use in nonisotopic detection systems for biomolecules e.g. nucleic acids, proteins, lipids or drugs. The nanocrystals have polynucleotide strands attached to their surfaces with one end of the polynucleotide extending outwardly from the nanocrystal. The present sequence is one such polynucleotide. These nanocrystals are used with a second series of nanocrystals, which have polynucleotides complementary to the first polynucleotides, so that the respective complementary to the first polynucleotides, so that the respective complementary strands hybridise to each other and form a dendrimer. This dendrimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Thymine bases. This sequence may therefore be used with a polynucleotide composed mainly of Adenine bases (AAAS8385)

New isolated saponin glycosyl hydrolase enzymes - used to develop prods. for the modification of microbial organisms and plants or plant prods.

Claim 35; Page 59; 113pp; English

AAT06025-26 are oligonucleotides useful as probes or primers designed from sequences conserved between saponin glycosyl hydrolases, especially avenacinase, tomatinase and ALP's (T06021-24). The enzymes are isolated from plant pathogenic fungi. The enzymes detoxify saponins by deglycosylation, which is sufficient to destroy the ability of the saponin to complex with membrane sterols. Saponin/sterol complexes in eukaryotic membranes results in pore formation and leakage of cell contents, with subsequent cell death. The DNA and proteins of the invention are useful in identification of related enzymes, structural studies of saponins and also for development of agents which can modulate SGH activity, e.g. for reducing pathogenicity of SGH-producing pathogens for specific hosts AATO6025/ NX AATO AXC AATO XX AATO XX AATO XX BADO XX COBS XX Synt XX Synt XX Synt XX Synt XX COBS XX CATO

                                                                                                                                                                                                                                                                                              Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (ORFS) of the genome of Chiamydia trachomatis (see AAZ01425). These ORPS encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chiamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoraganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal utertitis, epical diseases such as nongonococcal utertitis, epidymitis, cervicitis, salpingitis, perihepatitis, batholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

In the native state, the probe forms a hairpin conformation with hybridised termini. The proximity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present. Single mismatches can be detected. The invention relates generally to the use of metal surface quenchers such as particles or films for high sensitivity applications in, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        example,
```

The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Herl) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriasis. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1

Sequence 20 BP; 6 A; 4 C; 6 G; 4 T; 0 U; 0 Other;

Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.

Claim 1; Page 46; 169pp; English.

Sensitively detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher.

Example 2; Page 26; 62pp; English.

Homo sapiens

The present invention relates to genes located on the X-chromosome of mammals. These genes are specifically expressed in haploid cells of the testis and encoded amino acid sequences having homology with the amino acid sequences by a descriptions of the invention are used for gene diagnosis, discrimination of sex, sequences especially in livestock. They are also used in gene therapy. The present DNA sequence is a PCR primer which is used for the identification of sex primer which is used for the identification of genes by differential display method

Human oligonucleotide sequence 17-OCT-2003 (first entry)

Human ICAM oligonucleotide sequence.

(first entry)

17-OCT-2003

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 2' egions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nacal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention of has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cust in antisense or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of adenosine cut in a subject stissue, or treating bronchodomostriction, unus allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of denosine of the confidence of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lung surfactant in a subject's tissue, or treating bronchoconstriction, ung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 4682; 872pp; English.

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of undiquinted tung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genemic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiaschmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a new in antisense gene therapy. The composition is useful for treating or antisense gene therapy. The composition is useful for treating or accounting the composition is useful for treating or accounting the composition is useful.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5 or 3 and genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction as pecced active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of edenosine receptor, producing bronchodilation, increasing levels of ubiquinone or

ö The invention relates to a novel method for detecting a cell with a neoplastic or pre-neoplastic phenotype, comprising testing a sample cell for the presence of loss of heterozygosity at one or more loci on one or more chromosomes. The chromosomes are selected from a group of chromosome 1-22, where a loss of heterozygosity at one or more of the loci is indicative of a neoplastic or pre-neoplastic phenotype. The method of the invention has cytostatic activity. Detecting a cell with a neoplastic or pre-neoplastic confirmations, monitoring or treating the progression of neoplastic or pre-neoplastic conditions, e.g. PCR; primer, ss; neoplastic; pre-neoplastic; heterozygosity; cytostatic; urothelial neoplasia; p53; human. Detecting a cell with a neoplastic or pre-neoplastic phenotype, useful for diagnosing or treating neoplasia or pre-neoplastic conditions, comprises testing the cell for the presence of loss of heterozygosity at urothelial neoplasia. The present sequence represents a PCR primer used in the invention to amplify exon 5 of the p53 gene Gaps ö Target oligonucleotide #1 used in nonlinear optical technique. 0.9%; Score 15; DB 1; Length 20; 100.0%; Pred. The present invention relates to a method for detecting interactions between biological components using a nonlinear optical technique. The invention is used for screening candidate binding partner(s) for binding to test molecule. It can also be used to detect changes in orientation or conformation of the probe and/or target. The present sequence is a target oligonucleotide used in nonlinear optical technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ73325-81 represent oligonucleotides which hybridise specifically with DNA or RNA from a herpes virus gene corresponding to one of the open reading frames U15, -8, -9, -20, -27, 29, -30, -42, -52 or IE175 of herpes simplex virus type I (HSV-1). These oligos pref. hybridise with a translation initiation site, a coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New oligonucleotide(s) hybridising with DNA or RNA of herpesvirus gene are used in the treatment and diagnosis of herpes simplex virus, cytomegalovirus, Epstein Barr virus and varicella zoster infections.
                                                                                                                                                                                         Screening candidate binding partner(s) for binding to test molecule by applying external force field to sample in homogeneous phase, alluminating sample with light beam(s) at fundamental frequencies, and measuring physical properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hybridise; herpes simplex virus; HSV; open reading frame; translation initiation site; coding region; 5' UTR; ss.

Oligonucleotides such modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
                  infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibition; replication; herpes simplex virus; HSV; HIV; retard; human cytomegalovirus; influenza virus; influenza virus; influenze length; neurological disorders; phospholipase Activity; hyperproliferation; malignancy; cardiovascular disease; snake bite; malignancy; aging; ss.
region or a 5' untranslated region. These oligos may be used in compositions for the treatment and diagnosis of herpes viral infectic by contacting the virus or the animal, or its cells, tissues or body fluids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      modualting telomere length, which may also retard aging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAQ61913-16 are oligonucleotides which contain a G4 stretch and which may be used for inhibiting replication of human immunodeficiency virus (HIV). Oligonucleotides such as these may also be used for inhibiting activity of HSV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper- proliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VGGF). A parient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes nucleic acid molecules which modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.8%; Score 14.8; DB 1; Length 18; 88.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (5' UTR), 3' untranslated region (3' UTR), splice intranslated region (5' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene consent from env, gag, pol, rev and tar. The PNAs can be used to trarget RNA and single stranded DNA (ssDNA) to produce antiseise-type gene regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as stranded DNA. They are also bable to form triple helices in which a first PNA strand binds with RNA or sbDNA and a second PNA strand binds with the first PNA strand binds with the significant charge and are water soluble, which facilitates callular uptake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases.

The present sequence is a specifically claimed PNA sequence (represented by the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                               /*tag= a hotology at least one (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the mucleobase being attached covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
AAZ25553 to AAZ25582 represent specifically claimed antisense
oligonucleotides targeted to, and capable of inhibiting the expression of
nucleic acids encoding human RhoG. RhoG is a member of the Rho subfamily
of small GTPases the expression of which is associated with the induction
of mitosis by mitogens. RhoG is thought to be required for entry into the
coff mitosis by mitogens. RhoG is thought to be required for entry into the
coff mitosis by mitogens. RhoG is thought to be required for entry into the
coff mitosis and the actin cytoskeleton which regulates changes during
cell cycle progression (e.g. cell cycle. It also effects the dynamic
cell cycle progression (e.g. cell counding and pinching off during
mitosis) and with determining the density to which cells will proliferate
(RhoG affects an actin-dependent signal transduction pathway mediating
the level of contact inhibition through surface signals). Additionally,
RhoG is associated with the development of cancers (RhoG participates in
ca signalling pathway involving ras-mediated transformation). Antisense
compounds from the present invention may be used for inhibiting the
expression of human RhoG in cells and tissues in vitro and may be used
diagnostically to determine the role of RhoG in various biochemical
cycoskeleron and in cancer development). AAZ25590 to AAZ2559 represent
concernment when RhoG antisense oligonuclectides, but they do not inhibit RhoG

polynucleotides obtained from adult testes, foetal brain, adult brain, brain (foetal and adult), foetal kidney, adult spleen, and adult thymus brain (foetal and adult), foetal kidney, adult spleen, and adult thymus convail in the stress. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, yerokine and cell proliferation/differential activity, yerokine and cell proliferation/differential activity, hamone stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, and tunnour inhibition activity, The polynucleotides ignaphressor activity, and tunnour inhibition activity. The polynucleotides are also presently valuable for yeterinary applications. AAZSSSSS compositions are also presently valuable for veterinary applications. AAZSSSS compositions are also present human secreted proteins, and AAYY3300 to AAXSSSSS concepted proteins, and AAYY3300 to AAXSSSSS concepted proteins, given in the present invention.

AAZSSSSS concepted proteins given in the present invention.

AAZSSSSS concepted proteins given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotides and proteins having biological activities which make them suitable for treating, preventing or ameliorating medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding pycteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide sequence, AAF94645 - AAF94684 which target a RhoA nucleotide sequence, AAF946575 - AAF94686 - AAF94758 which target a RhoC nucleotide sequence, AAF947090 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target bycerpiclecative conditions, especially cancer, abnormal wound healing or clotting conditions and ischemia/reperfusion or recoxygenation injury. The compound may also be used to diagnose the above conditions
                                                                                                                                                                                           Rho; GTP binding protein; phosphorothioate antisense oligonucleotide;

The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
AGT02013. This is one of a set of oligonucleotides (see ABA91527-30) used
to assess the minimum number of ribonucleotides in DNA-RNA chimeric
coligonuclectides required for RNase H cleavage. Each oligonucleotide of
the set had a different number of ribonucleotides, 2 in the present case.
The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
(see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
minutes. The results showed that 4 ribonucleotides were the minimum
number for RNA cleavage. The invention provides probes for nucleic acid
hybridisation. The probes form a hairphin structure comprising a double-
stranded stem and a single-stranded loop, and are capable of both
intramolecular and intermolecular hybridisation. The double-stranded stem
may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
RNASE H cleavage. When the probe hybridises with a target DNA, the RNA
strand in the DNA:RNA duplex becomes sensitive to RNAse H treatment and
can be removed. Arrays and methods for nucleic acid hybridisation using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; colon cancer; tumour; abnormal cell growth; melanoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid (I) involved in growth regulation in human colonic epithelial cells, termed CATX. (I) is useful as a probe/primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis and treatment of abnormal cell growth (such as cervical and anomas). Colorectal adenocarcinomas, Wilms' tumour, leukaemias and prymphomas), in screening assays for the treatment of abnormal cell growth, for raising antibodies, and to screen for peptide analogues and antagonists. (I) is useful as a biomarker for human tumour cells, e.g., colon cancer cells, for generating probes and primers designed for identifying and/or cloning homologues in other cell types, in antisense therapy, and in tissue profiling. (I) identifies cancer cells at an early stage of development, so that premalignant cells can be identified prior to their spreading throughout the human body. (I) allows early detection of potentially cancerous conditions, and treatment of the cancerous conditions prior to spread of the cancer cells throughout the body, or prior to development of an irreversible cancerous condition. ABK27456.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in comprises numbered for discrimination are mixed in each of the multiwell plates numbered for discrimination are mixed from the areaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell completes; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed lones are cultured and the constituted are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42357 to ABL45322 represent per primers for human chromosome and ABL45322 represent propresent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rice, Oryza sativa var. synthase (ALS) gene encoding ALS resistant to pyrimidinyl carboxy herbicides. Plants which may be transformed with the mutant gene include rice, and also maize, barley, wheat, soya, cotton and tobacco. The mutant gene may be useful in the production of herbicide-resistant plants which can be cultivated in the presence of the herbicide. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                              유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                     The present invention describes acetolactic acid synthase (I) isolated from Oryza sativa var. Kinmaze (rice). (I) has resistance against pyrimidinylcarboxy (PC)-based herbicides as well as acetolactic acid synthase activity. (I) can be used for providing plants with high resistance against PC-based herbicides. The present sequence represents a PCR primer for (I) which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an oligonuclectide primer capable of specifically hybridising to a DNA having the sequence of the flanking regions of a microsatellite selected from M2-4-9, M2-2-9, M2-2-12, M2-3-11, M2-2-20, M2-2-21, M2-2-23, M2-2-24, M2-4-25, M2-4-36, M2-2-39, M2-2-32, M2-2-32, M2-3-32, M2-3-32, M2-3-36, M2-2-46. The primer is useful for determining the number of repeat units of the microsatellite cited above. The primer is useful in HLA-related research, such as genetic mapping of HLA class II-associated diseases, transplantation matching, population genetics, and diseases, transplantation hot spots as well as linkage
                                                                           Gene encoding acetolactic acid synthase, useful in providing new breeds of plannts with high resistance against pyrimidinylcarboxy-based herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide primer capable of specifically hybridizing to a DNA having the sequence of the flanking regions of a microsatellite (e.g. M249), useful for HLA-related research, e.g. transplantation matching.

                                                                                                                                                                                                                                                                                                                             A method has been developed for identifying an individual predisposed to autoimmune disease, a condition mediate by tumour necrosis factor (TNF) autoimmune disease, a condition or an inflammatory condition or infection. The method comprises detecting a mutated CD7 gene, which causes a predisposition, in a DNA-containing sample from the individual. The method is used to identify or treat a patient predisposed to or suffering from an autoimmune disease, especially rhemmatoid arthritis, a condition mediated by TNF-alpha or IFN-gamma, particularly lipopolysaccharide-induced shock, an inflammatory condition or an infection, and asthma. The present sequence represents a PCR primer used in the construction of a probe for detecting a disrupted mouse CD7 gene fragment in an example from the present invention

Representative examples of ribozyme recognition sites are given in AAA81415 to AAA86777. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                   Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

WPI; 2002-479562/51. RESULT 1172 ADE36879 g δ The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, and emacological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57877 to AAH62099 sepresent sequences used in the companion of the present invention ö Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases. The invention relates to an inhibitor of apoptosis (IAP) antisense

nucleic acid (I) that inhibite IAP biological activity, regardless of
length of the antisense nucleic acid, the IAP proteins may be mouse or
thuman XIAP, HIAPI or HIAP2. Also included are a pharmaceutical
composition comprising a mammalian IAP antisense molecule and a method of
composition comprising a mammalian IAP antisense molecule and a method of
enhancing apoptosis in a cell, comprising administering a negative
cregulator of the IAP anti-apoptotic pathway to the cell. The IAP
antisense inhibitor is useful for enhancing apoptosis in a cell in a
mammal diagnosed with a proliferative disease. The method is useful for
treating a patient diagnosed with a proliferative disease like cancer.
The IAP antisense molecule is useful to treat, ameliorate, improve,
sustain or prevent proliferative diseases (e.g. ovarian cancer,
adenocarcinoma, lymphoma, pancreatic cancer,) and also in diseases or
conditions where apoptosis is involved or implicated (e.g. embryonic
development, viral pathogenesis, lupus erythematosus and infection by herpes
virus, pox virus and adenovirus). The present sequence is an IAP
Novel antisense inhibitor of apoptosis nucleic acid useful for enhancing apoptosis in a cell, for treating cancer and other proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rhesus rotavirus; RRV; rhesus:human reassortant virus; virucide; antidiarrhoeic; gene therapy; vaccine; immune response; human rotavirus; diarrhoeal gastroenteritis; reverse-transcription; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid molecule comprising a gene segment from a rhesus rotavirus or from one of 3 rhesus:human reassortant viruses, useful for eliciting protective immune responses to human rotaviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rhesus rotavirus (RRV) reverse transcription PCR primer SEQ ID NO:145.

comprising a gene segment from a rhesus rotavirus (RRW) or from one of the three rhesus human reassorant viruses. Also described: (1) a vector comprising (1); (2) a recombinant bost cell comprising the vector; and (3) a method of producing a polypeptide encoded by (1), comprising culturing the recombinant host cell under conditions suitable for expression of the nucleic acid molecule. (1) has virucide and antidarkhoeic activities, and can be used in gene therapy and vaccines. The nucleic acid (1), or its variant, can be used in eliciting protective immune responses to human rotaviruses, which are major causes of diarrhoeal gastroenteritie in infants and young children. The present sequence represents a reverse transcription PCR primer which is used in
                                                                              The present invention describes an isolated nucleic acid molecule (I),

Amyloid beta precursor protein binding protein 159 kD (APPBP1) gene polymorphic variants, useful e.g. in studying the expression and function of APPBP1 and screening candidate drugs for treating Alzheimer's disease.

Claim 17; Page 13; 104pp; English.

The invention relates to an isolated polypeptide comprising a sequence beta precursor protein to a reference sequence for the amyloid beta precursor protein binding protein 1, 59kD (APPBPI) protein or its fragment. The polymorphic variants are useful in studying the expression and function of APPBPI, in expressing APPBPI protein for use in screening for candidate drugs to treat diseases related to APPBPI activity, in studying the effect of the variation on the biological activity of APPBPI, and the binding affinity of candidate drugs targeting APPBPI for

methods are useful in validating APPRP1 as a candidate target for treating a specific condition or disease predicted to be associated with APPBP1 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with APPBP1 activity. The transgenic animals are useful for studying expression of the APPBP1 isogenes in vivo, for in vivo screening and testing of drugs targeted against APPBP1 protein, and for testing the efficacy of therspeutic agents and compounds for disorders related to platelet aggregation in a biological system. Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.

Example 1; Page 27; 71pp; English

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensinogen) and/or ATI (type 1 angiotensin II receptor) genes, and comparing the polymorphic pattern with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI),

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-dalta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, dalta = V or N; V = adenine, gamma e thymine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma; in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                 response to treatments with ACB inhibitors, angiotensin II receptor antagonists, divetics, alpha- or beta-adensers/or receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular disease. Libraries of nucleic acids containing polymorphic positions in the 3 genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes
 They can also be used to predict
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nuclectides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma) K-delta-N3'; where X = a labelled compound and/or a nuclectide with voluntary sequence; m = 0 or 1; alpha = thywine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, quanine or cytosine; N = adenine, quanine, cytosine or thymine; gamma = thymine; k = thymine expressed by gamma is composed of repetition of gamma, in which thymine expressed by gamma is composed of 1;3 or less of adenine, quanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                    Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA sequence determination; gene sequence analysis; ss.
